                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    complementation of these adenoviral genes. Therefore, the pE4/Fiber plasmid was used as a complementation plasmid which was introduced into a host cell line where parts of the fiber and E4 gene region would be stably inserted into the host cell chromosomes. The resulting E4/fiber gene deficient plasmid can be used as a gene delivery vector. The vectors can be used for diagnosis or gene therapy, e.g. for treating conditions characterised by hyper-proliferative cells (e.g. tumours), genetic diseases (e.g. Huntington's disease, Tay-Sachs disease, or sickle cell disease), or infections (e.g. HIV infection). They can also be used for in vitro production of biologically active proteins. Sequence 10610 BP; 2807 A; 2821 C; 2446 G; 2536 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chimeric - 1
Chimeric - 1
and durable transgene expression

Example 2; Fig 10A-H; 74pp; English.

This is the DNA sequence of the recombinant adenovirus

H5.020TKneo-int. It was obtained by co-transfecting HEK293 (ATCC CRL1573) cells with linearised plasmid padneo-int (see T6055) and Ad5d17001. It was used as a control in studies of the retrotransposition and integration of cis- and trans-acting recombinant adenoviruses (see T60557 and T60558) into host cells. Claimed novel recombinant replication defective viruses (A) comprise: (a) DNA of, or corresponding to, at least part of the viral genome, able to infect a mammalian cell; and (b) a first

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    flanked by DNA of (a); (A) can infect a mammalian cell and ESI
c flanked by DNA of (a); (A) can infect a mammalian cell and can
c express (I) and transfer it to the cellular chromatin in vivo or in
c vitro in the presence of a transposase. Also new are: (1) a
recombinant replication defective virus (B) containing (a) as above
and a second expression sequence (ES2) containing a trans-acting
transposase gene (II) plus regulatory sequences, flanked by DNA of
(a) and able to express transposase in mammalian cells; and (2)
mammalian cells which stably express (I) integrated into its
chromatin, produced by infection with (A). (A) and (B) are used
for delivery and stable integration of (I) into a host cell
(claimed), e.g. in somatic gene therapy of genetic defects or
deficiencies such as cystic fibrosis. (A) are also used to prepare
recombinant retroviruses (RRY) (claimed). Because (I) becomes
stably integrated, it provides longer lasting expression than genes
introduced with conventional adenoviral vectors and the need for
repeated administration is avoided. The transgene is inherited by
the
progeny cells and the viral component is gradually degraded by the
cell. When used for RRV production, (A) increase the ratio of RRV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

This nucleotide sequence comprises plasmid pBHG11 that consists of 2C an E1-deleted adenovirus (Ad) genome. It contains a deletion of 2C an E1-deleted adenovirus (Ad) genome. It contains a deletion of 2C and5 (see also V0728) from bp 188-1339 (0.5-3.7 m.u.). This 2C deletion removes the packaging signals as well as E1 sequences. CC pBHG11 also contains a large deletion within the E3 region (bp 2C 27865-30995, 77.5-86.2 m.u.). Nucleotide 8773 of pBHG11 is 2C equivalent to nucleotide 7269 of Ad5. The large E3 deletion 2C provides a large cloning capacity to Ad vectors based on pBHG11. CC Recombinant plasmids pdelpol and pBHG11delpol (deleted for E1 and 2C polymerase functions), and pAXBdelpoldelpyTyARNA+13 and 2C perterminal protein functions), are specifically claimed. The 2C invention provides improved adenoviral vectors and packaging 2C within the E2D region of the adenoviral vectors and packaging 2C within the E2D region of the adenoviral genome (see also V07261). CC These E2D-deleted virus are used in conjunction with novel cell 2C witted vectors deleted for all viral coding regions. These 2CC salted vectors deleted for all viral coding regions. These 2CC salted vectors and sectors deleted for all viral coding regions. These 2CC witted vectors and sectors deleted by the transfer of the dystrophin 2CC signer to the muscle of mice. The E2D-deleted and gutted vectors convolde improved adenoviral vectors useful for a wide variety of

Example 2; Fig 8A-1; 74pp; English.

CThis is the DNA sequence of the cis-acting recombinant adenovirus CC His 1s the DNA sequence of the cis-acting recombinant adenovirus CC (ATCC CRL1573) cells with linearised plasmid pAdMLYneo-int (18e 760554) and Ad5617001. A trans-acting adenovirus (see CC F00558) was also produced, and retrottansposition and integration CC viruses. Claimed novel recombinant replication defective viruses (A) comprise: (A) DNA of, or corresponding to, at least part of the CC viruses. Claimed novel recombinant replication defective viruses (C) the cis-acting terminal repeat sequences of a transposon, and ESI CC expression sequence (ESI) comprising a human gene (I) linked to regulatory sequences for expression, with the cassette flanked by the cis-acting terminal repeat sequences of a transposon, and ESI CC express (I) and transfer it to the cellular chromatin vivo or in CC transposase sequence (II) plus regulatory sequences, flanked by DNA of (a); (A) can infect a mammalian cell; and (2) are combinant replication defective virus (B) containing (a) as above and a second expression sequence (ES2) containing a trans-acting CC virusesposase gene (II) plus regulatory sequences, flanked by DNA of (a) and able to express transposase (I) integrated into its mammalian cells which stably express (I) integrated into its chromatin, produced by infection with (A). (A) are also used to prepare (C claimed), e.g. in somatic gene therapy of genetic defects or deficiencies such as cystic fibrosis. (A) are also used to prepare (C claimed) integrated, it provides longer lasting expression than genes culturoduced with convention is avoided. The transgene is inherited by the correspondence of a ransolded. The transgene is inherited by the correspondence of a containing a crans cell containing a

                                                                                                                                                                                                                                             New adenoviral recombinant plasmid(s) - comprise sequences provided for expression of large foreign DNA fragments, used for, e.g. gene therapy of genetic disease(s) bisclosure; Page 69-86; 139pp; English.

This nucleotide sequence comprises the adenovirus 5 (Ad5) genome. The invention provides improved adenoviral vectors and packaging cell lines. One type of improved vector comprises deletions within the E2b region of the adenoviral genome (see also v07261).

These E2b-deleted virus are used in conjunction with novel cell lines that constitutively express E2b gene products. The invention calso provides vectors deleted for all viral coding regions. These 'gutted' vectors permit the transfer of large genes (e.g. up to 25 kb) to cells, as demonstrated by the transfer of the dystrophin gene to the muscle of mice. The E2b-deleted and gutted vectors gene to the muscle of mice. The E2b-deleted and gutted vectors gene therapy applications.

                                                                                                                                                                                                                       calso produced, and retrotransposition and integration into host cells was demonstrated in HeLa cells infected with both viruses. Claimed novel recombinant replication defective viruses (A) comprise: (A) DNA of, or corresponding to, at least part of the comprise: (B) DNA of, or corresponding to, at least part of the creative viruses (F) and the cell; and (C) a first expression sequence (ESI) comprising a human gene (I) linked to regulatory sequences for expression, with the cassette flanked by the cis-acting terminal repeat sequences of a transposon, and ESI clanked by DNA of (a); (A) can infect a mammalian cell and can express (I) and transfer it to the cellular chromatin in vivo or in vitro in the presence of a transposase. Also new are: (I) a recombinant replication defective virus (B) containing (a) as above and a second expression sequence (ES2) containing a trans-acting transposase gene (II) plus regulatory sequences, flanked by DNA of (a) and able to express transposase in mammalian cells; and (2) cmammalian cells which stably express (I) integrated into its chromatin, produced by infection with (A). (A) and (B) are used for delivery and stable integration of (I) into a host cell (claimed), e.g. in somatic gene therapy of genetic defects or deficiencies such as cystic fibrosis. (A) are also used to prepare recombinant retroviruses (RW) (claimed). Because (I) becomes stably integrated, it provides longer lasting expression than genes introduced with conventional adenoviral vectors and the need for concepted administration is availed.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          34162
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and durable transgene expression

Example 2; F1g 9A-1; 74pp; English.

This is the DNA sequence of the trans-acting recombinant adenovi:

H5.020CMYgag-pol. It was obtained by co-transfecting HEK293

(ATCC CRL1573) cells with linearised plasmid pAdCMYgag-pol (see
T60555) and Ad5d17001. A cis-acting adenovirus (see T60557) was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      24-OCT-1996; U17176.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ğ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
Example 10; Fig 28A-XX; 126pp; English.

CC This is the nucleotide sequence of vector 231-10, a human cadenovirus serotype 5 (Ad5) vector. 231-10 lacks the EIA, EIB cc adenovirus serotype 5 (Ad5) vector. 231-10 lacks the EIA, EIB cc adenovirus serotype 5 (Ad5) vector. 231-10 lacks the EIA, EIB cc adenovirus serotype 5 (Ad5) vector. 231-10 lacks the EIA, EIB cc adenovirus serotypes 5 (Ad5) vector. 231-10 lacks the EIA regions are cc and EIB transcription units. The deleted EIA and EIB regions are created and EIB regions are created and EIB regions are created with an expression cassette wherein all the EI proteins. The care expression of the human cytomegalovirus (CMV) promoter. The CC aderivative of virus rec700, which is an Ad5-Ad2-Ad recombinant ct that has the Ad2 version of the EI genes for the 12.5%, 6.7%, cc gplsk and RID-bata and 14.7% proteins. In addition, the vector has cc missense mutations in the adp (adenovirus death protein) genes cf that eliminate the first 2 Met codons, thereby precluding synthesis cof functional ADP. Because 231-10 lacks EIA, viral genes in the created by containing the vector serves as an cc expressed from the CMV promoter. Thus, the vector serves as an cc essentially inert vehicle by which EI genes can be delivered into cc cells. The invention provides a method for inhibiting apoptosis of CC a cell expressing a death receptor of the tumour necrosis factor internalisation and degradation (RID) protein complex containing cc expressing the RID complex or a composition containing the RID complex. The complex or a composition containing the RID complex. The complex or a composition containing the RID complex. The compositions and methods are used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    34825
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         34885

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                degenerative immunodeficiency diseases, particularly to decrease leukocyte apoptosis (claimed). Immune disorders that can be treated include autoimmune disorders, ischaemic injury such as caused by myocardial infarction, stroke induced neuron death and reperfusion injury, alcohol-induced hepatitis, diseases caused by viral infection such as AIDS and fulminant hepatitis, and cancer. The methods can also be used to promote tissue transplant survival. Vector 231-10 can be used to deliver the RID complex to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       engineering in general pisclosure; Pages 70-89; 116pp; English.

The sequence is that of the chimpanzee adenovirus C68. It mands to sequence is that of the comprising it and a select used in the production of a vector comprising it and a select heterologous gene operatively linked to regulatory sequences directing its expression in a heterologous cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Such recombinant adenoviruses are useful as vectors in gene therapy and genetic engineering in general, especially for the treatment of aquired or genetically inherited defects. The viruses are also useful for the in vitro production of recombinant proteins of interest.

                                                                                                                                                                                                                                                                                                   theterologous gene operatively linked to regulatory sequences directing its expression in a heterologous cell. Such recombinant adenoviruses are useful as vectors in gene therapy and genetic engineering in general, especially for the treatment of aquired or genetically inherited defects.
                                                                                                                                                                                                                                                           the treatment of aquired or genetically inherited defects. The viruses are also useful for the in vitro production of recombinant proteins of interest.

Adeno: virus-based gene therapy vectors - esp. useful for gene therapy of cystic fibrosis

Example 15; Page 84-95; 167pp; English.

Contains a gequence represents the nucleotide sequence of the second generation adenovirus vector named Ad2-ORF6/GK-CFTR. This virus lacks El and in its place comtains a modified transcription unit with the phosphoglycerate contains a modified transcription unit with the phosphoglycerate place comtains a modified transcription unit with the phosphoglycerate contains a modified transcription of the vactor has also been modified to promoter is only if moderate strength but it is long lasting and is not contained to shut off. The E4 region of the vactor has also been modified in that the whole sequence has been removed and replace by ORF6, the construct comprises a full length copy of the Ad2 genome from the DNA construct comprises a full length copy of the Ad2 genome from the DNA construct comprises a full length copy of the Ad2 genome from the CC which the early region 1 genes (El genes) have been deleted and replaced by an expression cassette encoding CFTR. The expression cassette conducter for PGK and a poly-A addition signal from the CC includes the promoter for PGK and a poly-A addition signal directly construct the promoter of the promoter in the construct of form the construct of the promoter of the promoter in the construct of the promoter of th

PT Recombinant adeno-associated virus contg. second gene which from the facilitates its conversion from single stranded to double stranded the facilitates its conversion from single stranded to double stranded for virus - enhances efficiency of ex vivo transduction into target cell for the stample 1; Page 69-72; 131pp; English.

Example 1; Page 69-72; 131pp; English.

This is the nucleotide sequence of a minigene containing the human cadenovirus type 5 (Ad5) E4 region open reading frame (ORF) 6 under control of the mouse mammary tumour virus promoter and a growth hormone terminator sequence. The minigene is used to generate a packaging cell line expressing the E4 ORF6 product which is used to rescue and package can E4 deficient recombinant adeno-associated virus (rAAV). The rAAV comprises at least 2 selected genes, the first gene able to express the composition gene able to convert the single stranded virus to its double stranded form upon expression. The rAAV is useful in pharmaceutical compositions for use in ex vivo and convert of the reaction of the target cell; and the second gene able to convert the single stranded virus to its double stranded form upon expression. The rAAV is useful in pharmaceutical compositions for use in ex vivo and convert cell dysfunctions, e.g. cystic fibrosis.

Recombinant adeno-associated virus contg. second gene which facilitates its conversion from single stranded to double stranded virus - enhances efficiency of ex vivo transduction into target cell Example 19; Page 108-114; 131pp; English.

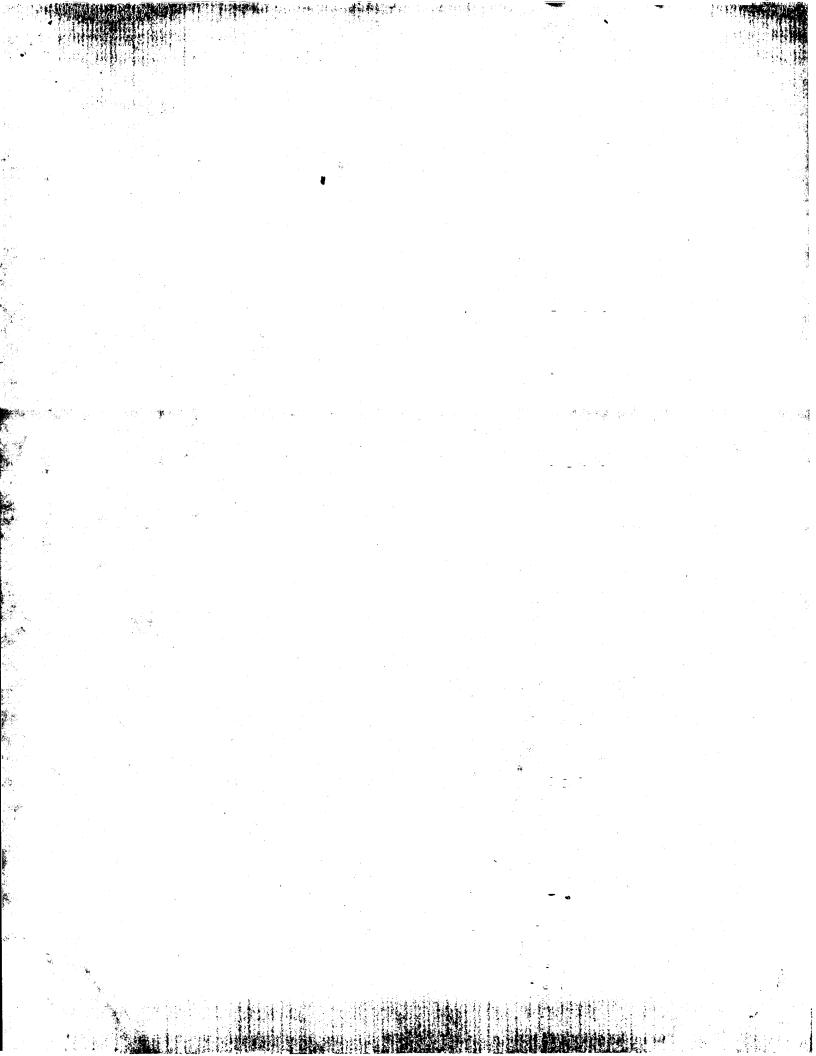

This is the nucleotide sequence of a second generation of recombinant adeno-associated virus (rAAV) which contains 2 genes, the first gene able to express the gene of interest (beta-galactosidase) in the target cell; and the second gene(AdS 24 ORF6) able to convert the single stranded virus to its double stranded form upon expression. The rAAV is useful in pharmaceutical compositions for use in ex vivo and in vivo gene therapy for the treatment of inherited diseases, cancer and other genetic dysfunctions, e.g. cystic fibrosis.

DNA polymerase; DNA-binding protein; RNA polymerase III;

BNA polymerase; DNA-binding protein; complete genome; genome-linked alternative splicing; coat protein; complete genome; genome-linked protein; glycoprotein; overlapping genes; polymerase; terminal repeat; unidentified reading frame; virus-associated RNA.

Human adenovirus type 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   aactactacacagagcgatctaagcggcgagaccggagacgcagatctgtttgtcacgcc
